Bee Bath

Pollinators have very important jobs that help grow the food we eat. They work hard all day, traveling miles in search of food, while spreading pollen from plant to plant.

Just like all living things, pollinators get thirsty. The little pollinators often have to search harder for a water source because they need a very shallow puddle to drink from so they don't drown.

An average honeybee hive can hold around 50,000 bees. That's a buzz worthy number!

Supplies Needed

-Shallow dish
-Hand-sized rocks or marbles

Bee Bath

1. Place your rocks or marbles evenly in the shallow dish. These create little islands for pollinators to land on and drink from.

2. Add just enough water to cover the surface of the dish.

3. Place outside anywhere in a garden or on a deck and watch for passing pollinators to take a drink!
